# Variation aware timing

- Timing analysis key component of chip design closure flow
  - Pre/post route optimization, timing sign-off
- Increasing significance of variability

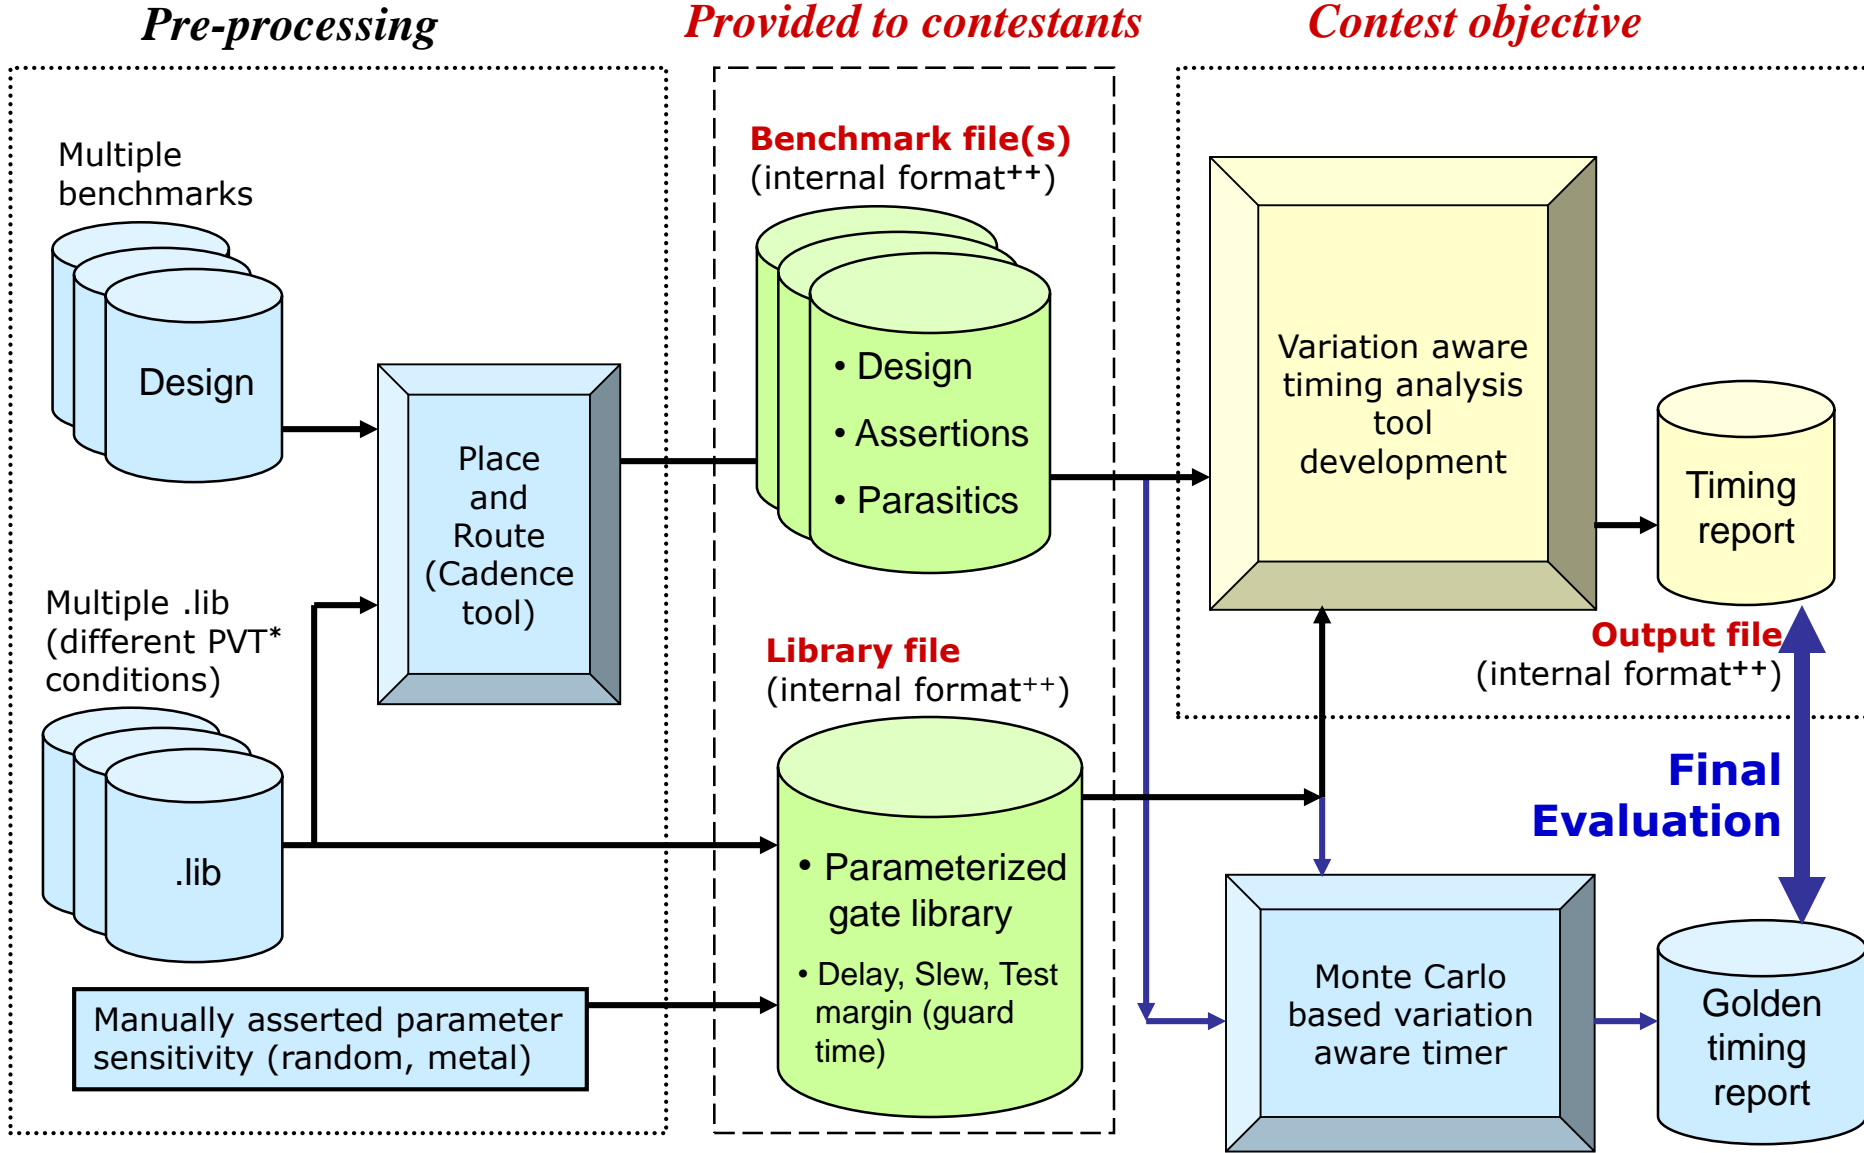

- Variability aware timing analysis essential
  - Growing chip sizes, complexity: Impacts timing analysis run-time
  - Trade-offs between modeling accuracy/complexity and run-time

# TAU 2013 variation aware timing analysis contest

---

- Goal: Seek novel ideas for fast, variation aware timing analysis by means of the following
  - Increase awareness of variation aware timing analysis, provide insight into some challenging aspects
  - Encourage novel parallelization techniques (including multi-threading)
  - Facilitate creation of a publicly available variation aware timing analysis framework and benchmarks for research/future contests
- Trade-offs for timing model complexity
  - Wanted focus on variation aware timing, understanding challenges for variation aware timing, tool performance
    - Feedback from prior contest committee: Teams spend too much time on infrastructure (e.g., parsers, fixing library/benchmark file bugs)
  - Chose to expand on single corner timing analysis contest from

# Timing analysis contest architecture

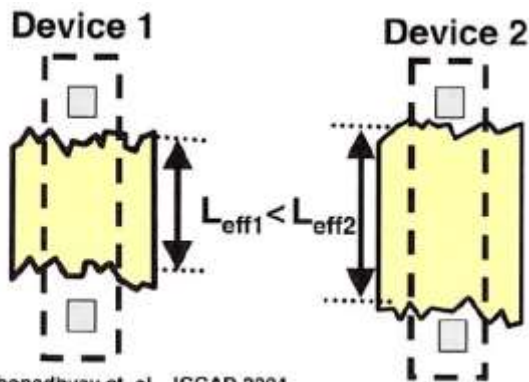

\*PVT – Process, Voltage, Temperature

++Format identical/extension to/of PATMOS'11 contest

# Sources of variability (**Parameters**)

- Six global (inter-chip) sources of variability
  - Environmental: Voltage (**V**), Temperature (**T**)
  - Front end of line process: Channel length (**L**), Device width (**W**), Voltage threshold (**H**)
  - Back end of line process: Metal (**M**)
    - All metal layers assumed perfectly correlated
- Random variability (**R**)
  - Intra-chip (across chip) systematic variability ignored

S. Mukhopadhyay et. al., ICCAD 2004

M Hane et al., SISPAD 2003

# Variability modeling

---

- Parametric linear model\*

$$\mu + a_v \Delta V + a_t \Delta T + a_l \Delta L + a_w \Delta W + a_h \Delta H + a_m \Delta M + a_r \Delta R$$

- Each parameter ( $\Delta V$ ,  $\Delta T$ , ...,  $\Delta R$ ) assumed as unit normal Gaussian
- Each sensitivity ( $a_v$ ,  $a_p$ , ...,  $a_r$ ) denotes first-order per-sigma sensitivity
- Parameter may vary between [-3, 3] sigmas

- Encouraged novel variability aware timing analysis techniques

- **Statistical timing** [Fewer runs, pessimism relief for random variability, *modeling inaccuracies/simplifications*]
- **Multi-corner timing** [Less complexity, faster analysis and potentially more accurate at each corner, *large number of corners, pessimistic for random variability*]
- **Monte Carlo based timing** [Less complexity, most accurate, *very long run-times*]
  - Golden timer's approach: Used for accuracy evaluations only
- **Hybrid/novel approach for variability aware timing** [?]

# Interconnect (wire) modeling considering variability

- Wire parasitics (RC values) function of metal parameter ( $\Delta M$ )
  - Provided sigma (corner) specific scale factors for parasitics
  - Tap capacitance contribution from gate input pin unaffected
  - Parametric input slew
- Parametric wire delay and output-slew
  - First order sensitivity to metal and other parameters may be computed via model-fitting (e.g. finite-differencing) for a statistical timer
  - Complex parametric output slew computation

Corner delay at nominal metal corner (0 sigma):

$$d_5 = R_A(C_1 + C_3 + C_4) + (R_A + R_B) C_2 + (R_A + R_B + R_E) C_5$$

Corner delay at "thick" metal corner ( $\sigma$  sigma):

$$d_{5|\Delta M=\sigma} = m_R^\sigma R_A (m_C^\sigma [C_1 + C_3 + C_4 - C_{p,4}] + C_{p,4}) + (m_R^\sigma [R_A + R_B + R_E]) (C_{p,5} + m_C^\sigma (C_5 - C_{p,5})) + (m_R^\sigma [R_A + R_B]) m_C^\sigma C_2$$

Corner specific scale factors

First order metal sensitivity:

$$\alpha_{m,5}^D = \frac{d_{5|\Delta M=\sigma} - d_{5|\Delta M=0}}{\sigma - 0}$$

Parametric wire delay:

$$d_5 + \alpha_{m,5}^D \Delta M$$

# Combinational gate (cell) modeling

- Extended linear gate delay/slew model from PATMOS'11 contest to variation aware model

$$\begin{aligned}
 D &= a (1 + k_{d,v} \Delta V + k_{d,t} \Delta T + k_{d,l} \Delta L + k_{d,w} \Delta W \\
 &\quad + k_{d,h} \Delta H + k_{d,r} \Delta R) + b C_L + c S_i \\
 S_o &= x (1 + k_{s,v} \Delta V + k_{s,t} \Delta T + k_{s,l} \Delta L + k_{s,w} \Delta W \\
 &\quad + k_{s,h} \Delta H + k_{s,r} \Delta R) + y C_L + z S_i
 \end{aligned}$$

- **Sensitivities** (to parameters, input slew, load) provided in gate library
- Lumped load model (no effective Capacitance/current source models)
- Note: Input slew ( $S_i$ ) and load ( $C_L$ ) are **parametric** models

# Sequential gate (flip-flop) modeling

- Test (Setup/hold) margin or guard-times a linear function of slews at clock and data points

$$t_{setup} = g + h S_i^{CK} + j S_i^D$$

$$t_{hold} = m + n S_i^{CK} + p S_i^D$$

- **Sensitivities** (to input slews) provided in gate library
- **Parametric slews**  $\rightarrow$  Parametric guard-time

# Parametric timing analysis

---

- Traditional timing analysis/propagation
  - Forward propagation of signal arrival times (*at*), and *slews*
  - Backward propagation of signal required arrival times (*rat*)
  - *Slack* computation
- Nuances
  - Worst slew propagation (when 2+ signals meet at a point)
  - Separate propagation for early, late modes, and rise, fall transitions
    - Needs *maximum, minimum* operations on parametric quantities
    - Could be expensive for statistical timing, inaccuracy concerns
  - Single clock domain
  - No coupling, common path pessimism reduction, loops

# Projection techniques and tool output

---

- Projection of parametric values: 3 modes required for contest

$$\mu + a_v \Delta V + a_t \Delta T + a_l \Delta L + a_w \Delta W + a_h \Delta H + a_m \Delta M + a_r \Delta R$$

- **MEAN**: Nominal value ( $\mu$ )
- **SIGMA\_ONLY**: Standard deviation ( $\sqrt{a_v^2 + a_t^2 + a_l^2 + a_w^2 + a_h^2 + a_m^2 + a_r^2}$ )
- **WORST\_CASE**: Worst 3 sigma projection of metal parameter, random parameter, and all other parameters combined together (*via root sum square*)

$$(\mu \pm 3\sqrt{a_v^2 + a_t^2 + a_l^2 + a_w^2 + a_h^2} \pm 3|a_m| \pm 3|a_r|)$$

- Required tool output

- Must report projected values (based on shell variable **\$TAU\_PROJECTION**)
- Set of lines specifying for each primary output in design
  - Arrival times and slews (for early/late/rise/fall combinations)
- Set of lines specifying for a subset of pins in design
  - Slacks

# Contest timeline

Feb 8, 2013	<ul style="list-style-type: none"><li>• <b>Detailed calculations</b> for toy benchmark provided</li><li>• <b>Monte Carlo results</b> for benchmarks ver1.0 provided</li><li>• New variation aware gate library provided</li><li>• Updated contest rules document</li><li>• Contestants requested to provide <b>early binaries</b> of tool for <u>compatibility testing</u></li></ul>
Feb 20, 2013	<ul style="list-style-type: none"><li>• 5 new large benchmarks provided (largest benchmark ~88K gates)</li></ul>
Feb 28, 2013 (~4+ months)	<ul style="list-style-type: none"><li>• <b>Final tool binaries due</b> for evaluation</li></ul>
Mar 27, 2013	<ul style="list-style-type: none"><li>• <b>Results announced</b></li></ul>

# Teams

- 8 teams
  - China (1 – Tsinghua Univ. Beijing)
  - Greece (1 – Univ. of Thessaly Volos)
  - India (2 – IIT Madras, IISc Bangalore)
  - Singapore (1 – No affiliation)
  - Taiwan (2 – National Tsing Hua Univ., National Chiao Tung Univ.)
  - USA (1 – Illinois Institute of Technology, Chicago)

- ★ Registered team
- ★ Contest committee member

# Interesting tool characteristics

---

- Statistical, Monte Carlo based – No multi-corner timers
- Statistical maximum/minimum (*max/min*) operation nuances
  - Used Clark’s [Operations Research’61] moment calculation approach, and Visweswariah *et al.* approach [DAC’04]
  - “Smart” – Compare means and do statistical *max/min* in select cases
  - Consider neglected correlation between signal inputs – Better accuracy of output distribution. Based on Naderjah *et al.* [IEEE TVLSI’08]
- Parallelization – Two teams employed *pthreads*
  - **Multi-threaded** netlist parsing
  - **Multi-threaded** wire pre-processing
  - Circuit levelization
  - **Multi-threaded** forward propagation
  - **Multi-threaded** backward propagation

**Benchmarks ver 2.0**

- 20 of 36 benchmarks used for final evaluations ( > 250 gates)
- Largest test-case ~88.4K gates
- 6 large benchmarks not released to contestants earlier
- All benchmarks now available on webpage

# Evaluation metrics

- Score model for each benchmark:  $A * \{ 0.5 + 0.3/T + 0.2/M \}$ 
  - Accuracy score (A):** Equally weighted sum of *average-arrival time accuracy, average-slew accuracy, average-slack accuracy, worst accuracy, accuracy of worst design slack*
  - Based on **WORST-CASE** projected mode results only
  - Scoring different for pessimistic versus optimistic result

Score for pessimistic answer	100	95	90	80	70	70	50	0	0
Score for optimistic answer	100	90	80	70	50	0	0	0	0

% accuracy (relative to cycle time)

# Evaluation metrics (contd.)

---

- Score model for each benchmark:  $A * \{ 0.5 + 0.3/T + 0.2/M \}$ 
  - **Run-time score (T):** Tool run-time (seconds) per 1K gates
  - Average run-time for single threaded statistical timer found ~ **1sec/1K** gate benchmark
  - **Memory score (M):** Tool peak memory (in 100Mbs) per 1K gates
  - Average memory for single threaded statistical timer found ~ **100Mb/1K** gate benchmark
- Final evaluation nuances
  - Evaluation on 2.33Ghz Quad core machine, 24Gb Ram, up to 8 threads
  - Accuracy paramount – Monte Carlo based timer to generate golden
  - Biased towards tools with better run-time/memory for similar accuracy
  - Final score is sum of all (20) benchmark scores

# Tool comparison for **top 3 teams**

Team <b>Id</b>	<b>Team T13_11</b> <i>IIT Madras, India</i>	<b>Team T13_13</b> <i>National Tsing Hua University, Taiwan</i>	<b>Team T13_14</b> <i>National Chiao Tung University, Taiwan</i>
Timer	Statistical <u>multi</u> threaded	Statistical single threaded	Statistical single threaded
Num. benchmarks that <u>crash tool</u>	2	0	3
Missing pin slacks	Few	None	Few
~Average accuracy	0.72	1.0	0.45
~Average run-time	0.3	1.0 [~ 1sec/1K gates]	17.0 ( <i>varied between 0.3 – 200</i> )
~Average memory	3.2	1.0 [~ 100Mb/1K gates]	0.3

- Accuracy scores indicated within 3% accuracy of statistical timing (for given benchmarks, library) for arrival times and slews
- Slack accuracy and worst timing accuracy using statistical timer usually within 10% of Monte Carlo results

# Summary

---

- Variation aware timing analysis contest
  - Increase awareness of variation aware timing analysis, provide insight into some challenging aspects
    - **Parametric timing propagation**
    - **Model fitting/finite-difference concept, inaccuracies**
    - **Parametric maximum/minimum operations**
    - **Projection techniques – Pessimism relief**
  - Encourage novel parallelization techniques
    - **Multi-threaded timers**
  - Facilitate creation of a publicly available variation aware timing analysis framework and benchmarks for research/future contests
    - **Framework for potential concepts on parametric path tracing**
    - **Variability aware timing macro-modeling, coupling, etc.**
- Reference: Sinha *et al.*, TAU 2013 Variation aware timing analysis contest, ISPD 2013

# Final results

- Plaques and cash awards for the top three teams
